TIME TRAVELING THROUGH OUR COASTAL HISTORY USING SEASHELLS: A STEAM APPROACH

JULY 16-19, 2019

This new multiday workshop will link science, history, and art in looking at the environmental history of the northern Gulf Coast. Through lectures, hands-on activities, and time aboard the R/V Alabama Discovery, we’ll investigate how living and historical molluscan communities and radiocarbon dating are used to explore dead zones and the history of human impacts on Alabama’s coastal waters. Along the way, we’ll discover a way to help your students time travel through our environmental history by participating in the Postcards from the Past STEAM outreach project.

This workshop is a partnership among Discovery Hall Programs, Dr. Paul Harnik (Franklin and Marshall College) and Ms. Nancy Raia (Eastern Shore Art Center) and is designed for middle and high school teachers.
